

The ITHealth Dashboard

A unified asset intelligence platform to enhance visibility, improve security, and streamline compliance

The Challenge: Managing Risk in a Complex Digital Environment

As organisations across all sectors continue to digitise operations, they face increasing cyber risks — from ransomware and endpoint vulnerabilities to unpatched systems and regulatory pressure.

Limited budgets, lean digital teams (especially in cyber-specific roles), and fragmented infrastructures only compound the challenge. Many organisations struggle to gain a complete view of their IT estate, making it difficult to assess risk exposure, prioritise action, or demonstrate compliance.

At the heart of the issue lie fragmented systems, inconsistent records, and limited reporting.

Effective cyber security starts with *knowing what you have and understanding how vulnerable it is*. Yet, for many organisations, gaining clear, comprehensive visibility across the digital estate remains a major challenge.

Without real-time, accurate asset visibility, it's difficult to take a proactive approach to cyber security. Disconnected tools and incomplete data create blind spots that hinder risk management and slow down response.

Organisations need **a single source of truth** — a centralised platform that consolidates asset intelligence across devices, users, vulnerabilities, and compliance. This unified view enables teams to monitor risk, surface vulnerabilities, and take control without adding operational burden.

In today's evolving threat landscape, enhancing visibility and control of the IT estate is no longer a technical 'nice-to-have' — it's essential to business resilience and regulatory assurance.

Key issues include:

- ▶ **Siloed tools and fragmented data** limit visibility across the digital estate - making it difficult to assess risk and compliance.
- ▶ **Manual, time-intensive processes** for patching, asset tracking, and compliance reporting can be complex and increase the risk of human error.
- ▶ **Untracked or misconfigured devices** remain vulnerable and open the door to cyber incidents and audit failures.
- ▶ **Onerous audit and compliance preparation** for frameworks like ISO 27001, Cyber Essentials, NCSC Cyber Assessment Framework (CAF), plus other internal governance reviews.

The Solution: A single platform to monitor, manage and improve cyber posture and compliance

The ITHealth Dashboard is a cyber security and compliance management platform trusted by organisations in regulated, complex environments. It provides real-time visibility across the IT, IoT, and operational technology (OT) estate — empowering teams to identify risk, prioritise remediation, streamline compliance, and act with confidence.

Key features include:

1. Real-time Unified Asset Intelligence

Centralised view of your IT, IoT and OT estate - devices, users, software, patches, and vulnerabilities. Quickly flags risks like outdated systems, missing patches, and non-compliant configurations.

2. Full IT Asset Lifecycle Management

Track unlimited assets from purchase to disposal with secure, on-premise hosting for full data control and compliance.

3. Comprehensive Patch Reporting

Reboot-aware insights provide patch status and trends, highlighting devices missing critical updates to reduce exposure.

4. Robust Vulnerability Management

Leverages CVE, CVSS, EPSS, and KEV scores to prioritise and track exploitable risks across your estate.

5. Cyber Assessment Framework (CAF) Compliance

Streamlines compliance with collaborative workflows, task delegation, progress tracking, and audit-ready reporting.

6. Flexible Integrations - Single Source of Truth

Seamlessly integrates with tools like Microsoft Defender, Intune, Active Directory, SCCM, Heimdal, Sophos, and more, to unify insights into your estate.

7. Blind Spot Detection

Identifies unmanaged devices missed by other systems - eliminating manual cross-checks and reporting errors.

8. Information Asset Register

Simplifies management of suppliers and systems with linked asset records.

9. Asset Usage Monitoring

Tracks device usage to support cost recovery and reallocation, unlocking real savings from underutilised equipment.

10. KPI and Executive Reporting

Generates clear, visual reports highlighting risks, compliance gaps, and trends for both technical teams and senior leaders.

11. ITHealth Service Wrap

Offers bespoke reports, custom dashboards, and tailored widgets to meet your organisation's specific needs.

12. User Community and Resources

Access a Resource Hub, virtual monthly drop-ins with live Q&A and updates, user forums, and an active customer community for shared learning.

13. Included Training and Healthchecks

Free training sessions and regular health checks maximise value and ensure ongoing optimisation.

14. Continuous Innovation and Customer-Led Development

Receive new features at no extra cost*, with a roadmap driven by customer feedback to ensure relevance and impact. *(*Substantial changes, like new modules, may incur additional fees, though we minimise these where possible.)*

Highlights

Improved cyber security through increased visibility

Streamlined and simplified compliance

Increased operational efficiencies

Enhanced collaboration across teams

Proven and trusted by 150+ highly-regulated organisations

An ITHealth supported solution
